Experience

Solana India Fellowship 2025 (Superteam India)

Jul 2025 – Sep 2025

Advanced Rust and Solana fellowship focused on system design, Solana infra and Anchor development. Graduated top 20 with a \$3000 stipend.

Super30 (100xSchool)

Sep 2025 – Mar 2026

Hacker house style program at 100xCampus, Noida focused on backend projects, Solana, and distributed systems.

Rektoff Solana Security Bootcamp (Cohort 3)

Jan 2026 – Mar 2026

Low-level Rust and Solana security, with a final capstone auditing a complex Solana program. Wrote the strongest audit report in the cohort.

Projects

Decimal (live on devnet: decimal.finance)

Solana, Squads, TypeScript, React, PostgreSQL

- Built an AI-powered accounts payable product: vendor invoices are parsed by AI into structured payment orders, routed for approval, and paid in USDC with an on-chain proof of payment.
- Integrated Squads v4 multisig as the self-custodial treasury: an AI agent pays within code-enforced spending limits and falls back to a multisig proposal when a bill exceeds policy, so approval rules are enforced on-chain, not in the backend.
- Built the AI layer end to end: vision-model invoice extraction with Zod-validated structured output and retries, plus a payment-automation agent service with its own eval suite.
- Designed and built the entire stack solo: React frontend with TanStack Query, Express and Prisma API on PostgreSQL, and Privy embedded wallets for in-product approvals.

Meteora DLMM Indexer

Rust, Yellowstone gRPC, ClickHouse, Redis, React

- Built a real-time Meteora DLMM data platform with Yellowstone ingestion, IDL-driven decode, and enriched event pipelines.
- Designed a ClickHouse-backed system with structured data flows and Redis-based signaling for ingestion and processing.
- Developed a Rust backend powering APIs and a live React dashboard for monitoring DLMM pool activity.

Trading Exchange Platform

TypeScript, Redis Streams, PostgreSQL, Next.js

- Built a high-performance real-time trading exchange for CFD trading with leverage, automated liquidation, and stop-loss / take-profit execution.
- Designed the engine around Redis Streams and consumer groups for price updates, command processing, responses, and asynchronous trading events.
- Implemented in-memory trade and balance state with PostgreSQL persistence and compressed snapshot-based recovery for fault tolerance.

Solana Hedge Fund Program

Rust, Anchor, Solana

- Implemented a hedge-fund-style pool on Solana where managers create funds and investors deposit SOL to receive shares based on NAV.
- Designed atomic borrow/settle trading flows for managers to trade whitelisted assets with controlled execution.
- Built platform-level controls including global whitelists and keeper-driven execution for limit, DCA, and rebalance strategies.

Education

B.E. Computer Science

2021 – 2025

Osmania University, Hyderabad

The Knowledge Society (TKS)

2022 – 2024

Innovate and Activate Program, Global
